- GRAVITATIONALLY BOUND DARK MATTER
- PLACING DIRECT LIMITS ON THE MASS OF EARTH-BOUND DARK MATTER
- CAN THE FLYBY ANOMALY BE ATTRIBUTED TO EARTH-BOUND DARK MATTER?
- PLANET-BOUND DARK MATTER AND THE INTERNAL HEAT OF URANUS, NEPTUNE, AND NOT-JUPITER EXOPLANETS

GRAVITATIONALLY BOUND DARK MATTER

COSMOLOGY SUGGESTS THAT ONLY $\sim 4\%$
OF THE MASS-ENERGY DENSITY OF THE
UNIVERSE IS ORDINARY BARYONIC MATTER

$\sim 23\%$ IS GRAVITATIONALLY ATTRACTIVE
"DARK MATTER"

$\sim 73\%$ IS GRAVITATIONALLY REPULSIVE
"DARK ENERGY"

LITTLE IS KNOWN ABOUT DARK MATTER:

- IS IT BOSONIC OR FERMIONIC ?
- IS IT SELF-ANNIHILATING (EITHER ITS OWN ANTIPARTICLE, OR EQUAL ABUNDANCES OF PARTICLE AND ANTIPARTICLE)

OR NON-SELF-ANNIHILATING ?

- WHAT ARE MASS (MASSES) AND NON-GRAVITATIONAL INTERACTIONS ?
- HINTS OF DIRECT DETECTION DAMA/LIBRA PAMELA

DARK MATTER CAN BE GRAVITATIONALLY BOUND ON DIFFERENT SCALES

- GALACTIC HALO DARK MATTER

MASS DENSITY $\rho \sim 0.3 \text{ GeV}/c^2 \text{ cm}^{-3}$

- SOLAR SYSTEM-BOUND DARK MATTER?

$$\rho < 10^5 \text{ GeV}/c^2 \text{ cm}^{-3}$$

FROM STUDY OF PLANETARY ORBITS

- EARTH AND PLANET-BOUND DARK MATTER?

SUBJECT OF THIS TALK:

BOUNDS

IMPLICATIONS

PLACING DIRECT LIMITS ON THE MASS OF EARTH-BOUND DARK MATTER

CAN SET A DIRECT LIMIT ON THE TOTAL EARTH-BOUND DARK MATTER MASS LYING BETWEEN THE RADIUS $\sim 384,000$ km OF MOON'S ORBIT, AND THE RADIUS $\sim 12,300$ km OF LAGEOS GEODETIC SATELLITE ORBIT

FOR A SATELLITE OF NEGLIGIBLE MASS IN CIRCULAR ORBIT AROUND BODY OF MASS M , MEASUREMENT OF ORBIT RADIUS R AND ORBIT PERIOD T GIVES GM :

$$GM = \frac{4\pi^2 R^3}{T^2}$$

- LAGEOS TRACKING GIVES GM_{\oplus}
EARTH MASS M_{\oplus} INCLUDES DARK MATTER WITHIN THE LAGEOS ORBIT
- LUNAR ORBITERS GIVE GM_m
(ASSUME MOON-BOUND DARK MATTER MASS TO BE NEGLIGIBLE)

- MORE ACCURATE DETERMINATION OF M_m COMES FROM TRACKING ERAS ASTEROID, WHICH IS INFLUENCED BY EARTH'S AND MOON'S GRAVITY - GIVES

$$R_{\oplus/m} \equiv \frac{GM_{\oplus} + G\Delta M_{\oplus}}{GM_m} \quad \leftarrow \text{POSSIBLE EARTH-BOUND DARK MATTER CONTRIBUTION}$$

$$= \frac{GM_{\oplus}}{GM_m} (1 + \delta) \quad \delta = \frac{\Delta M_{\oplus}}{M_{\oplus}}$$

- COMBINED EARTH-MOON SYSTEM
LUNAR LASER RANGING DETERMINES THE COMBINED MASS (TIMES G) OF THE EARTH-MOON SYSTEM:

$$GM_{\text{combined}} = GM_{\oplus} + GM_m + GM_{dm}$$

M_{dm} = DARK MATTER MASS LYING BETWEEN THE RADIUS OF MOON AND LARGES ORBITS

SO

$$GM_{dm} = GM_{\text{combined}} - GM_{\oplus} - GM_m$$

↗
LUNAR ORBITER DETERMINATION

OR USING EROS

$$GM_{\text{combined}} - GM_{\oplus} = \frac{GM_{\oplus}}{R_{\oplus}/m}$$

$$\approx GM_{dm} + GM_{ms} = GM_{dm} + \frac{M_m}{M_{\oplus}} G \Delta M_{\oplus}$$

SINCE $M_m/M_{\oplus} \approx 0.0123$, THIS GIVES

$$GM_{\text{combined}} - GM_{\oplus} = \frac{GM_{\oplus}}{R_{\oplus}/m} \approx GM_{dm} + 0.0123 G \Delta M_{\oplus}$$

$$> GM_{dm}$$

$$\approx GM_{dm} (1 + 0(.01)) \quad \text{IF } \Delta M_{\oplus} \sim M_{dm}$$

NUMERICAL (ALL CONVERTED TO BARYCENTRIC DYNAMICAL TIME)
(SIENA TURYSHEV, JPL)

$$\text{LAGEOS} \Rightarrow GM_{\oplus} = 398,600.4356 \pm 0.0008 \text{ km}^3 \text{ s}^{-2}$$

$$\text{LUNAR RANGING} \Rightarrow GM_{\text{combined}} = 403,503.2357 \pm 0.0019 \text{ km}^3 \text{ s}^{-2}$$

$$\text{EROS} \Rightarrow R_{\oplus}/m = 81.300570 \pm 0.000605$$

$$+\text{LAGEOS } GM_{\oplus} \Rightarrow GM_m = 4902.8000 \pm 0.0003 \text{ km}^3 \text{ s}^{-2}$$

COMBINING THESE,

$$GM_{dm} \approx (0.0001 \pm 0.0016) \text{ km}^3 \text{ s}^{-2}$$
$$= (0.3 \pm 4) \times 10^{-9} GM_{\oplus}$$

DOMINANT ERROR COMES FROM

GM_{combined} FROM LUNAR LASER RANGING

so $M_{dm} \lesssim 4 \times 10^{-9} M_{\oplus}$

IF THIS BOUND WERE ATTAINED, AND THE MASS WERE UNIFORMLY DISTRIBUTED BELOW THE MOON'S ORBIT, THE DENSITY WOULD BE

$$\rho \sim 6 \times 10^{10} \text{ GeV}/c^2 \text{ cm}^{-3}$$

MUCH LARGER THAN THE LIMIT ON SUN-BOUND DARK MATTER ($\sim 10^5 \text{ GeV}/c^2 \text{ cm}^{-3}$) AND EVEN STILL LARGER THAN THE GALACTIC HALO DENSITY -

so THERE IS ONLY A WEAK CONSTRAINT ON EARTH-BOUND DARK MATTER

CAN THE FLYBY ANOMALY BE

ATTRIBUTED TO EARTH-BOUND DARK MATTER?

Anderson et. al.
PRL 100, 091102 (2008)

OUTGOING VELOCITY EXTRAPOLATED FROM INCOMING VELOCITY DOES NOT AGREE WITH MEASURED VALUE

| PARAMETER | GALILEO I | GALILEO II | NEAR | CASINI | ROSETTA | MESSENGER |
|--|-----------|------------|---------|---------|---------|-----------|
| DATE | 12/8/90 | 12/8/92 | 1/23/98 | 8/18/99 | 3/4/05 | 8/12/05 |
| ΔV_{∞} ($\frac{mm}{s}$) | 3.92 | -9.6 | 13.96 | -2 | 1.80 | 0.02 |
| σV_{∞} ($\frac{mm}{s}$) | 0.3 | 1.0 | 0.01 | 1 | 0.03 | 0.01 |

↗
LATITUDE ANALOG IN
CELESTIAL COORDINATE
SYSTEM

$$k = \frac{2\omega_E R_E}{c} = 3.099 \times 10^{-6}$$

ω_E = EARTH ANGULAR ROTATION VELOCITY

R_E = EARTH RADIUS $\approx 6,371$ km

(AS WE SHALL SEE, ANALYSIS OF DRAG-FREE
CLOSED ORBITS DOES NOT SUPPORT THIS FORMULA,
WHICH SHOULD BE TREATED AS PURELY EMPIRICAL)

FOUR POSSIBILITIES:

- EFFECT IS AN ARTIFACT - SOME ESSENTIAL PHYSICS HAS BEEN OMITTED FROM THE ORBITAL CALCULATION
- NEW ELECTROMAGNETIC PHYSICS
- NEW GRAVITATIONAL PHYSICS (NON-MOND)
- EFFECT COMES FROM COLLISIONS WITH EARTH-BOUND DARK MATTER ... ANALYZE THIS

• ELASTIC AND INELASTIC DARK MATTER SCATTERING

ASSUMES:

- BOTH INITIAL PARTICLES NONRELATIVISTIC

$$|\vec{u}_1| \ll c \quad |\vec{u}_2| \ll c$$

- CENTER OF MASS SCATTERING AMPLITUDE $f(\theta)$ DEPENDS ONLY ON POLAR SCATTERING ANGLE $\theta \Rightarrow$ OUTGOING NUCLEON VELOCITY CHANGE, AVERAGED OVER SCATTERING ANGLES, IS

$$\langle \vec{v}_1 \rangle = \frac{m_2 \vec{u}_2 - m_2' \vec{u}_1}{m_1 + m_2'} + \kappa \frac{\cos \theta}{|\vec{u}_1 - \vec{u}_2|} (\vec{u}_1 - \vec{u}_2)$$

WITH κ THE POSITIVE SQUARE ROOT OF

$$\kappa^2 = \frac{m_2 m_2'}{(m_1 + m_2)(m_1 + m_2')} (\vec{u}_1 - \vec{u}_2)^2 + \frac{\Delta m m_2'}{m_1(m_1 + m_2')} \left[2c^2 - \frac{(m_1 \vec{u}_1 + m_2 \vec{u}_2)^2}{(m_1 + m_2)(m_1 + m_2')} \right]$$

AND WITH

$$\langle \cos \theta \rangle = \frac{\int_0^\pi d\theta \sin \theta \cos \theta |f(\theta)|^2}{\int_0^\pi d\theta \sin \theta |f(\theta)|^2}$$

ELASTIC SCATTERING CASE:

$$\Delta m = 0 \quad m_2' = m_2 \quad \Rightarrow$$

$$\langle \delta \vec{v}_1 \rangle = -2 \frac{m_2}{m_1 + m_2} (\vec{u}_1 - \vec{u}_2) \langle \sin^2 \frac{\theta}{2} \rangle$$

INELASTIC CASE: ASSUME $\frac{\Delta m}{m_2}$, $\frac{m_2'}{m_2}$ ARE $O(1)$

\Rightarrow x^2 DOMINATED BY SECOND TERM

$$\langle \delta \vec{v}_1 \rangle \simeq \frac{\vec{u}_1 - \vec{u}_2}{|\vec{u}_1 - \vec{u}_2|} \left(\frac{2 \Delta m m_2'}{m_1 (m_1 + m_2')} \right)^{1/2} c \langle \cos \theta \rangle$$

FOR $\vec{u}_{1,2} \sim 10 \text{ km s}^{-1} = 10^6 \text{ cm s}^{-1}$, THE VELOCITY CHANGE IN THE INELASTIC CASE IS LARGER THAN THAT IN THE ELASTIC CASE BY $\frac{c}{|\vec{u}_1|} \sim 10^9$, AND OPPOSITE IN SIGN

$$\frac{\text{FORCE}}{\text{UNIT MASS}} = \delta \vec{F} = \int d^3 u_2 \langle \delta \vec{v}_1 \rangle |\vec{u}_1 - \vec{u}_2| \sigma \rho(\vec{x}, \vec{u}_2)$$

VELOCITY CHANGE
IN SINGLE SCATTER

FLUX

CROSS
SECTION

DARK MATTER
(SPATIAL + VELOCITY
DISTRIBUTION)

INTEGRATING $\frac{\text{WORK}}{\text{UNIT MASS}}$ ALONG SPACECRAFT

TRAJECTORY \Rightarrow

$$\delta \frac{1}{2} (\vec{V}_f^2 - \vec{V}_i^2) = \vec{V}_f \cdot \delta \vec{V}_f = \int_{t_i}^{t_f} dt \frac{d\vec{x}}{dt} \cdot \delta \vec{F}$$

$$= \int_{t_i}^{t_f} dt \int d^3 u_2 \frac{d\vec{x}}{dt} \cdot \langle \delta \vec{V}_1 \rangle | \vec{u}_1 - \vec{u}_2 \rangle \rho(\vec{x}, \vec{u}_2)$$

IF $\rho(\vec{x}, \vec{u}_2) = \rho(\vec{x}, -\vec{u}_2)$ THEN:

- ELASTIC: AVERAGED VELOCITY CHANGE OPPOSITE TO $\frac{d\vec{x}(t)}{dt}$
 \Rightarrow POSITIVE DRAG COEFFICIENT
 REDUCTION IN SPACECRAFT VELOCITY

- INELASTIC: AVERAGED VELOCITY CHANGE PARALLEL TO $\frac{d\vec{x}(t)}{dt}$
 \Rightarrow NEGATIVE DRAG COEFFICIENT
 INCREASE IN SPACECRAFT VELOCITY

TO GET NEGATIVE DRAG ON SOME TRAJECTORIES,
 POSITIVE ON OTHERS, NEED EITHER

- TWO - COMPONENT DARK MATTER, WITH DIFFERENT SPATIAL DENSITIES $\rho(\vec{x}, \vec{u}_2)$ GOVERNING THE INELASTIC AND ELASTIC CASES

- OR
- SINGLE COMPONENT WITH $\rho(\vec{x}, \vec{u}_2) \neq \rho(\vec{x}, -\vec{u}_2)$

- QUANTITATIVE ESTIMATES: 10^{-6} FRACTIONAL VELOCITY CHANGE OVER TIME INTERVAL T NEEDS

$$10^{-6} \sim T \bar{v} \sigma \bar{\rho} | \langle \delta \vec{v}_i \rangle | / | \vec{v}_i |$$

$$\Rightarrow \sigma \bar{\rho} \sim 10^{-6} | \vec{v}_i | / (T \bar{v} | \langle \delta \vec{v}_i \rangle |)$$

"NEAR" FLYBY $T = 3.7 \text{ h} \sim 10^4 \text{ s}$
 $\bar{v} \sim 10^6 \text{ cm s}^{-1}$

DEFINE $\bar{\rho}_m = m_2 \bar{\rho} = \text{DARK MATTER MASS DENSITY}$

ELASTIC: $\sigma \bar{\rho}_m \sim 10^{-16} \text{ cm}^{-1} (m_1 + m_2) \geq 10^{-16} \frac{\text{GeV}}{c^2} \text{ cm}^{-1}$

INELASTIC: $\sigma \bar{\rho}_m \sim 10^{-20} \text{ cm}^{-1} [m_1 (m_1 + m_2)]^{1/2} \geq 10^{-20} \frac{\text{GeV}}{c^2} \text{ cm}^{-1}$

FOR $\sigma = 1$ PICOBARN $= 10^{-36} \text{ cm}^2$,

ELASTIC $\bar{\rho}_m \sim 10^{20} \frac{\text{GeV}}{c^2} / \text{cm}^3$

INELASTIC $\bar{\rho}_m \sim 10^{16} \frac{\text{GeV}}{c^2} / \text{cm}^3$

FOR $\sigma = 1$ MILLIBARN $= 10^{-27} \text{ cm}^2$,

ELASTIC $\bar{\rho}_m \sim 10^{11} \frac{\text{GeV}}{c^2} / \text{cm}^3$

INELASTIC $\bar{\rho}_m \sim 10^7 \frac{\text{GeV}}{c^2} / \text{cm}^3$

ALL MUCH GREATER THAN

GALACTIC NALO $\bar{\rho}_m \approx 0.3 \frac{\text{GeV}}{c^2} / \text{cm}^3$

FLYBY VELOCITY CHANGES OCCUR WITHIN RADIUS 70,000 km

FOR DARK MATTER MASS WITHIN THIS RADIUS NOT

TO EXCEED $4 \times 10^9 M_\odot$, NEED $\bar{\rho}_m \leq 10^{13} (\text{GeV}/c^2) \text{ cm}^{-3}$

REQUIRES $\sigma_{\text{inel}} > 10^{-33} \text{ cm}^2$

$\sigma_{\text{el}} > 10^{-29} \text{ cm}^2$

● DARK MATTER ACCUMULATION CASCADE?

SOLAR SYSTEM MOVES THROUGH GALAXY

WITH $V_{s.s.} \sim 220 \text{ km s}^{-1}$

LET $f_{c.s.}$ = PROBABILITY OF CAPTURE OF A

DARK MATTER PARTICLE IN EARTH ORBIT

RADIUS $A \approx 1.5 \times 10^8 \text{ km}$

CAPTURE PARTICLES IN ANNULUS OF AREA $2\pi A dA$

OVER $T_{s.s.} \sim 1.5 \times 10^{17} \text{ s}$, REDISTRIBUTE INTO

VOLUME $4\pi A^2 dA \Rightarrow$ AT RADIUS A

$$\frac{\rho_{m;s.s.}}{\rho_{m; halo}} \sim \frac{f_{c.s.}}{2A} V_{s.s.} T_{s.s.} \sim 10^{11} f_{c.s.}$$

KNOWN LIMIT ON $\rho_{m;sr}$ IS $3 \times 10^5 \rho_{m; halo}$

$$\Rightarrow f_{c.s.} \leq 3 \times 10^{-6}$$

ANALOGOUS CALCULATION FOR EARTH MOVING IN

SOLAR SYSTEM \Rightarrow

$$\frac{\rho_{m;sc}}{\rho_{m;sr}} \sim \frac{f_e}{4R} v_e T_{s.s.} \sim 2 \times 10^{13} f_e$$

\uparrow
 $70,000 \text{ km}$

\Rightarrow EVEN WITH SMALL f_e , COULD GET DARK MATTER DENSITIES LARGE ENOUGH TO EXPLAIN THE FLYBY ANOMALY, IF ϵ IS LARGE ENOUGH

• CONSTRAINTS

•• CLOSED ORBIT CONSTRAINTS

MOST GENERAL FORM OF DRAG FORCE THAT GIVES ZERO CUMULATIVE DRAG FOR ALL CLOSED SATELLITE ORBITS

$$\delta W = \int d\theta D(\vec{x}, \vec{v}) \quad D(\vec{x}, \vec{v}) = \frac{d\vec{x}}{d\theta} \cdot \delta \vec{F}$$

$$\int_0^{2\pi} d\theta D(\vec{x}(\theta), \vec{v}(\theta)) = 0 \quad \Rightarrow$$

$$D(\vec{x}, \vec{v}) = \sum_{l=1}^{\infty} (a_l \sin l\theta + b_l \cos l\theta) \quad b_0 = 0$$

FOR A HYPERBOLIC FLYBY ORBIT WITH DEFLECTION ANGLE $2\theta_D$,

$$\delta \frac{1}{2} (\vec{V}_f^2 - \vec{V}_i^2) = 2 b_0 \theta_D + 2 \sum_{l=1}^{\infty} \frac{b_l}{l} \sin l\theta_D$$

DETAILS OF NEAR-EARTH ENVIRONMENT APPEAR THROUGH THE b_l

KINEMATICS OF VANISHING DRAG ANOMALY FOR CLOSED ORBITS DOES NOT GIVE THE ANDERSON ET. AL FITTING FORMULA \Rightarrow THERE MAY BE DRAG ANOMALIES IN SATELLITE ORBITS

QUESTION: IF ONE FITS ALL SATELLITES TO

$$\text{DRAG} = D_1 \times \text{AREA} + D_2 \times \text{MASS},$$

- IS THERE EVIDENCE FOR D_2 ?
- IF NOT, WHAT BOUNDS CAN ONE PLACE ON D_2 ?

ASSUMING NOW NO FINE-TUNING TO CANCEL b_0 ,
 THE RATE AT WHICH THE RADIUS OF AN ORBITING
 BODY INCREASES OR DECREASES CAN BE USED TO
 BOUND A DRAG FORCE ACTING ON IT \Rightarrow A BOUND
 ON $\sigma \bar{\rho}_m$ ACTING ON ORBIT. WHEN OPTICAL
 DEPTH IS \ll RADIUS OF ORBITING BODY, σ
 DROPS OUT AND WE GET A BOUND ON $\bar{\rho}_m$

EARTH $A \sim 1.5 \times 10^8 \text{ km}^2$ ORBIT RADIUS

$$\Delta R \lesssim 1.5 \text{ cm / ORBIT}$$

$$\Rightarrow \bar{\rho}_{\text{m.s.c.}} < 2 \times 10^2 (\text{GeV}/c^2) \text{ cm}^{-3}$$

BASED ON INELASTIC DARK MATTER SCATTERING

\Rightarrow EARTH CAPTURE FRACTION IN CASCADE
 SCENARIO MUST OBEY

$$f_c \geq \frac{0.2 \times 10^{-35} \text{ cm}^2}{\sigma}$$

$$\sigma = 10^{-33} \text{ cm}^2 \Rightarrow f_c \geq 0.2 \times 10^{-2} \quad \sigma = 10^{-27} \text{ cm}^2 \Rightarrow f_c \geq 0.2 \times 10^{-8}$$

MOON

$$A_m \sim 384,000 \text{ km}$$

$$dA_m \lesssim 0.28 \text{ cm/orbit}$$

$$\Rightarrow \bar{\rho}_{m,ic} \lesssim 10^4 \text{ (GeV/c}^2\text{) cm}^{-3}$$

\Rightarrow DARK MATTER DENSITY AT MOON'S ORBIT
MUST BE \ll DENSITY WITHIN 70,000 km

LAGEOS

BOUNDS ON RESIDUAL ACCELERATIONS

$$\Rightarrow \bar{\rho}_{m,ic} \lesssim 3 \times 10^{-26} \text{ (GeV/c}^2\text{) cm}^{-3} \quad (\text{INELASTIC})$$

\Rightarrow DARK MATTER DENSITY AT LAGEOS ORBIT
RADIUS MUST BE \ll DENSITY AT RADII RELEVANT
FOR FLYBY ANOMALY

•• STELLAR (AND SOLAR) DYNAMICS CONSTRAINTS

EFFECT OF DARK MATTER CAPTURE ON STELLAR
DYNAMICS DISCUSSED BY FAIRBAIRN, SCOTT + EDSJÖ

$$\Rightarrow \bar{\rho}_{m,s.s.} \lesssim \frac{10^{-33} \text{ cm}^2}{\epsilon} \text{ (5 TO 50) GeV/c}^2 \text{ cm}^{-3}$$

FOR SELF-ANNIHILATING DARK MATTER

FOR NON-SELF-ANNIHILATING DARK MATTER,
THIS RESTRICTION CAN BE WEAKENED BY
FACTOR $\sim 10^5$, WHEN DARK MATTER

SECONDARY ESCAPES FROM SUN

•• EARTH AND SATELLITE HEATING CONSTRAINTS

EARTH HEATING - IF DARK MATTER SECONDARY ESCAPES FROM EARTH, ONLY KINETIC ENERGY OF RECOILING NUCLEON IS DEPOSITED

$$\delta T_1 \sim m_1 \frac{(\vec{v}_1)^2}{2}$$

$$\frac{\delta T_1}{\Delta m c^2} \sim \frac{m_2}{2 m_1}$$

DEPENDS ON DARK MATTER MASS m_L

FOR $m_2 \sim 10$ keV, GET BOUND

$$\rho_{m; R_\oplus} \leq 10^9 (60 \text{V } c^2) \text{ cm}^{-3}$$

AGAIN, IMPLIES THAT DARK MATTER DENSITY MUST BE DEPLETED NEAR EARTH (SIMILAR TO CONCLUSION FROM LABS CONSTRAINT)

FLYBY TEMPERATURE GAIN

$$\text{TEMP GAIN} \sim \frac{\langle T \rangle}{|\vec{v}_1|} 10^{-6} |\vec{u}_1| \sim \frac{1}{2} m_1 |\vec{v}_1| 10^{-6} |\vec{u}_1|$$

INELASTIC: $\text{TEMP GAIN} \sim \frac{1}{2} 10^{-6} m_2 |\vec{u}_1| c$
 $\sim 0.2 \text{ } ^\circ\text{K} \left(\frac{m_2 c^2}{\text{MeV}} \right)$

ELASTIC: $\text{TEMP GAIN} \sim \frac{1}{2} 10^{-6} m_2 |\vec{u}_1| |\vec{u}_1 - \vec{u}_2|$
 $\sim 10^{-5} \text{ } ^\circ\text{K} \left(\frac{m_2 c^2}{\text{MeV}} \right)$

⇒ DARK MATTER MASS $\ll 6\text{eV}$

COULD CALORIMETRY IN HIGH ORBITING SPACECRAFT
 BE USED FOR DARK MATTER DETECTION?

FLYBY STRUCTURAL DISRUPTION

IF EACH INDIVIDUAL NUCLEON RECOIL SHOULD NOT
 PRODUCE STRUCTURAL CHANGES, NEED

$$\langle T \rangle < E_{\text{binding}}$$

INEL: $m_2 c^2 < (m_1 c^2 E_{\text{binding}})^{1/2} \sim 100 \text{ keV}$

FOR

$$E_{\text{binding}} \sim 10 \text{ eV}$$

SUMMARY ON FLYBY - ESTIMATES DO NOT RULE OUT DARK MATTER EXPLANATION (FOR EXAMPLE, DO NOT REQUIRE $f_e \gg 1$)

- BUT CONSTRAINTS ARE SEVERE

- NEED EXOTHERMIC INELASTIC SCATTERING OF DARK MATTER ON ORDINARY MATTER
- DARK MATTER MUST BE WELL WITHIN MOON'S ORBIT AND DEPLETED NEAR EARTH'S SURFACE
- CASCADE ACCUMULATION MECHANISM REQUIRED TO REACH NEEDED DARK MATTER DENSITY
- DARK MATTER MASS MUST BE WELL BELOW A GeV
- INTERACTION CROSS SECTION WITH NUCLEONS MUST BE RELATIVELY HIGH
($10^{-33} \text{ cm}^2 < \sigma < 10^{-27} \text{ cm}^2$)
- DARK MATTER MUST BE NON - SELF - ANNIHILATING

PLANET-BOUND DARK MATTER, AND
THE INTERNAL HEAT OF URANUS, NEPTUNE,
AND HOT-JUPITER EXOPLANETS

LET f = FRACTION OF DARK MATTER
ANNIHILATION ENERGY THAT IS DEPOSITED
IN A PLANET WHEN A DARK MATTER
PARTICLE IS ACCRETED

f CAN BE $\ll 1$ FOR EXAMPLE,
IF THE SECONDARY m_2 IS VERY WEAKLY
INTERACTING AND ESCAPES, $f \sim \frac{1}{2} \frac{m_2}{m_1}$

IF $m_2 \ll m_1 = \text{NUCLEON MASS}$, THEN $f \ll 1$

CONSIDER A PLANET WITH OUTWARD
ENERGY FLOW PER UNIT AREA OF SURFACE $\equiv H$

ASSUME IT IS IMMERSSED IN A DARK
MATTER CLOUD, WITH MASS DENSITY ρ_m
AND MEAN VELOCITY $v \sim \left(\frac{GM_{\text{planet}}}{R_{\text{planet}}} \right)^{1/2}$
NEAR PLANET'S SURFACE

INCLUDING A SOLID ANGLE FACTOR OF $1/2$,
 THE CONDITION FOR ALL OF H TO BE
 SUPPLIED BY DARK MATTER CAPTURE IS

$$\frac{1}{2} \rho_m c^2 v f = H$$

\Rightarrow DARK MATTER DENSITY AT ENERGY FLUX
 EQUILIBRIUM IS

$$\rho_m = \frac{K_{\text{planet}}}{f}$$

$$K_{\text{planet}} = \frac{2H}{c^2 v} \sim \frac{2H}{c^2} \left(\frac{R_{\text{planet}}}{GM_{\text{planet}}} \right)^{1/2}$$

FROM PLANETARY HEAT FLOW DATA
 (de Sterck & Lissauer) GET

$$K_{\text{Earth}} = 0.12 \text{ GeV}/c^2 \text{ cm}^{-3}$$

$$K_{\text{Jupiter}} = 1.6 \text{ GeV}/c^2 \text{ cm}^{-3}$$

$$K_{\text{Saturn}} = 1.0 \text{ GeV}/c^2 \text{ cm}^{-3}$$

$$K_{\text{Uranus}} < 0.04 \text{ GeV}/c^2 \text{ cm}^{-3}$$

$$K_{\text{Neptune}} = 0.3 \text{ GeV}/c^2 \text{ cm}^{-3}$$

FOR f_{cc1} , ρ_m FOR EQUILIBRIUM IS
IN THE POSSIBLE RANGE FOR SUN-BOUND
OR PLANET-BOUND DARK MATTER

THUS, A SUBSTANTIAL FRACTION OF PLANETARY
INTERNAL HEAT GENERATION COULD COME FROM
DARK MATTER ACCRETION: COULD ACCOUNT
FOR UNEXPLAINED RESIDUAL HEAT PRODUCTION
IN EARTH, JUVIAN PLANETS, AND "HOT-JUPITER"
EXOPLANETS

URANUS ANOMALIES: ROTATION AXIS TILTED
 90° WITH RESPECT TO PLANE OF SOLAR
SYSTEM, AND VERY LOW HEAT PRODUCTION -
MUCH LESS THAN NEPTUNE

IF HEAT PRODUCTION IS LARGELY ASSOCIATED
WITH A PLANET-BOUND DARK MATTER CLOUD,
THEN THE COLLISION THOUGHT TO HAVE TILTED
THE AXIS OF URANUS COULD ALSO HAVE
KNOCKED IT OUT OF ITS ASSOCIATED DARK
MATTER CLOUD, LEAVING URANUS WITH A
MUCH REDUCED INTERNAL HEAT PRODUCTION
